week-13-lesson–1

Task 1. Rewrite the compareStrings() function from Chapter 9 to use character pointers instead of arrays.

```
int  compareStrings (const char  s1[], const char  s2[])
{
    int  i = 0, answer;

    while ( s1[i] == s2[i] && s1[i] != '\0'&& s2[i] != '\0' )
        ++i;

    if ( s1[i] < s2[i] )
        answer = -1;               /* s1 < s2  */
    else if ( s1[i] == s2[i] )
        answer = 0;                 /* s1 == s2 */
    else
        answer = 1;                 /* s1 > s2  */

    return answer;
}
```

Task 2. Print the elements of array numbers using pointer/offset notation with the pointer nPtr.

Task 3. Write a program to find a number in an array and print out the index if the element is found. Use a separate function to find the number. The function accepts and returns a pointer.

Task 4. Write a program to calculate the sum of all elements in the array. Use a separate function to calculate the sum. The function accepts a pointer.

Task 5. Write a program to concatenate two strings using pointers.

Task 6. Write a program to find a substring of the string using pointers.

Task 7. Write a program to Find the Length of a String using pointers.

Task 8. Given the definition of a date structure as defined in this chapter, write a function called dateUpdate() that takes a pointer to a date structure as its argument and that updates the structure to the following day (see Program 8.4).
