

week-2, lesson-3

Task 1

Write a program that reads in the radius of a circle and prints the circle's diameter, circumference and area. Use the constant value 3.14159 for π . Perform each of these calculations inside the printf statement(s) and use the conversion specifier %f.

Task 2

Write a program where the user is prompted to enter two integers. The message should warn that the first number is larger than the second number. Then the program performs four operations: addition, subtraction, multiplication and division. Print the header message above each operation with the results.

Task 3

Write a program where the user enters three values for a, b, c. The program should find the value of x given the equation $ax^2 + bx + c = 0$.

Task 4

Write a program where the user needs to enter some number. It is the money the user has. The program should display how many kilos of apples the user purchases and the changes the user receives. Given that the price of the apple is 453 KZT.

Task 5

Enter a four-digit number, extract each digit, and calculate their sum.

Terminal command to compile the file task1.c:

```
gcc task1.c -o task1
```

In task 3 we need to include math.h library and if you use Ubuntu OS add -lm flag

```
gcc task3.c -o task3 -lm
```
